Vineyard Pine Commercial Stormwater Management Analysis

Project Name: **Vineyard Pine Commercial**

Project Address: **4502 Vineyard Pine Lane
Rolesville, NC**

Pins: **175843022**

Latitude: **N 35.906083**
Longitude: **W -79.688333**

Zoning: **OP- CZ**

River Basin: **Neuse**

Watershed: **Lower Neuse**

HUC: **0302020107**

Developer: **MRR Development, LLC
10121 Capital Blvd., Suite 105
Wake Forest, NC 27587**

Telephone: **(330) 573-4030**

Email: **Omar@Meinekenc.com**

Site Description

The project consists of a single parcel located at the intersection of Jonesville and Vineyard Pine Lane in Rolesville. The lot is approximately 1.45 acres (63,259 sq feet). The parcel is vacant with grassy vegetation with approximately 0 sq ft of impervious area. The project will consist of a commercial building and associated parking.

The impervious area post development will be 1.09 acres.

The site is in the Neuse River Basin, Lower Neuse Watershed and subject to those rules regarding nutrient management and post storm water runoff.

Based on the Wake County SCS soils map (attached) the onsite soils are primarily Durham Series (DuB), soil group B, throughout the tract. The Durham Series soil type is considered to be well drained soils and based on information in the Soil Survey.

Proposed Development

The stormwater analysis considers a proposed development that will include one commercial building and associated parking on the site. One underground Storm Filter with pipe detention is proposed for the stormwater requirements. The treatment associated with Storm Filter accounts for the impervious area for the parcel and the device is proposed to treat the first inch of rainfall and control runoff within the drainage areas as shown on the attached drainage map EX1.

The Storm Filter SCM is a proprietary device approved by NCDNR and developed by Contech Engineered Solutions LLC. Detail design calculations are included within this report.

The device is designed in accordance with NCDENR DWR's BMP Manual, and will manage the 2, and 10 year, 24-hour storm events as noted below. The post development runoff from the noted storm events is less than the pre-development rates for the site.

Methodology (Peak Flow and Nutrient Management)

The project is located within the Town of Rolesville's / Wake County permitting authority, and within the Neuse River / Milburnie Lake watershed and the project is subjected to those rules listed in the LDO, Appendix B, Section 1.2 Stormwater Management, Adopted 6-1-2021.

Under the Town's LDO stormwater requirements as noted below. The project is considered a High-Density project.

Development Standards for High-Density

Projects High-Density Projects shall implement stormwater control measures that comply with each of the following standards, in addition to the General Standards found in subsection B of this section:

- a. The measures shall control and treat runoff from the first inch of rain. Runoff volume drawdown time shall be a minimum of 48 hours, but not more than 120 hours.*
- b. All structural stormwater treatment systems used to meet these requirements shall be designed to have a minimum of 85 percent average annual removal for Total Suspended Solids (TSS).*
- c. All Development and Redevelopment projects required to manage storm water shall provide permanent on-site BMPs to lower the nitrogen export amounts as part of the storm water management plan. BMPs are to be in accordance with and as specified in the Design Manual*

- d. Structural and Non-structural BMPs shall be used to ensure there is no net increase in peak flow leaving the site from the pre-Development conditions for the one-year, 24-hour storm. Runoff volume drawdown time shall be a minimum of 48 hours, but not more than 120 hours.*
- e. General engineering design criteria for all projects shall be in accordance with 15A NCAC 2H .1008(c), as explained in the Design Manual*

The POI (point of interest) for the project is at the southeast corner of the site as shown on EX1.

Based on the proposed stormwater management system for the project no adverse impact is anticipated on adjacent parcels. The BMP system will tie into an existing junction box located along the eastern property line. The existing pipe system discharges into a ditch along the southern portion of the site.

Using the SCS Method, the modeling of the BMP at the POI provides the following results in peak flow management. **The methodology used to determine the runoff is the SCS Method and the Time of Concentration used in both the pre and post analysis is 5 minutes.**

Runoff Summary

Total site peak runoff in cfs (noted in the attached Hydraflow report) is as follows.

Storm Event	Pre	Post
Q1	1.38	.94
Q10	4.74	1.82

Nutrient Management

The BMP provides treatment for drainage area within the project and also provides the TSS removal of 85%.

O&M Manual

A copy of the project's O&M manual is attached for the Storm Filter device.

Flood Hazard Area

The parcel is not located within a flood zone as noted per FEMA map 3720175800K, Dated July 19, 2022.

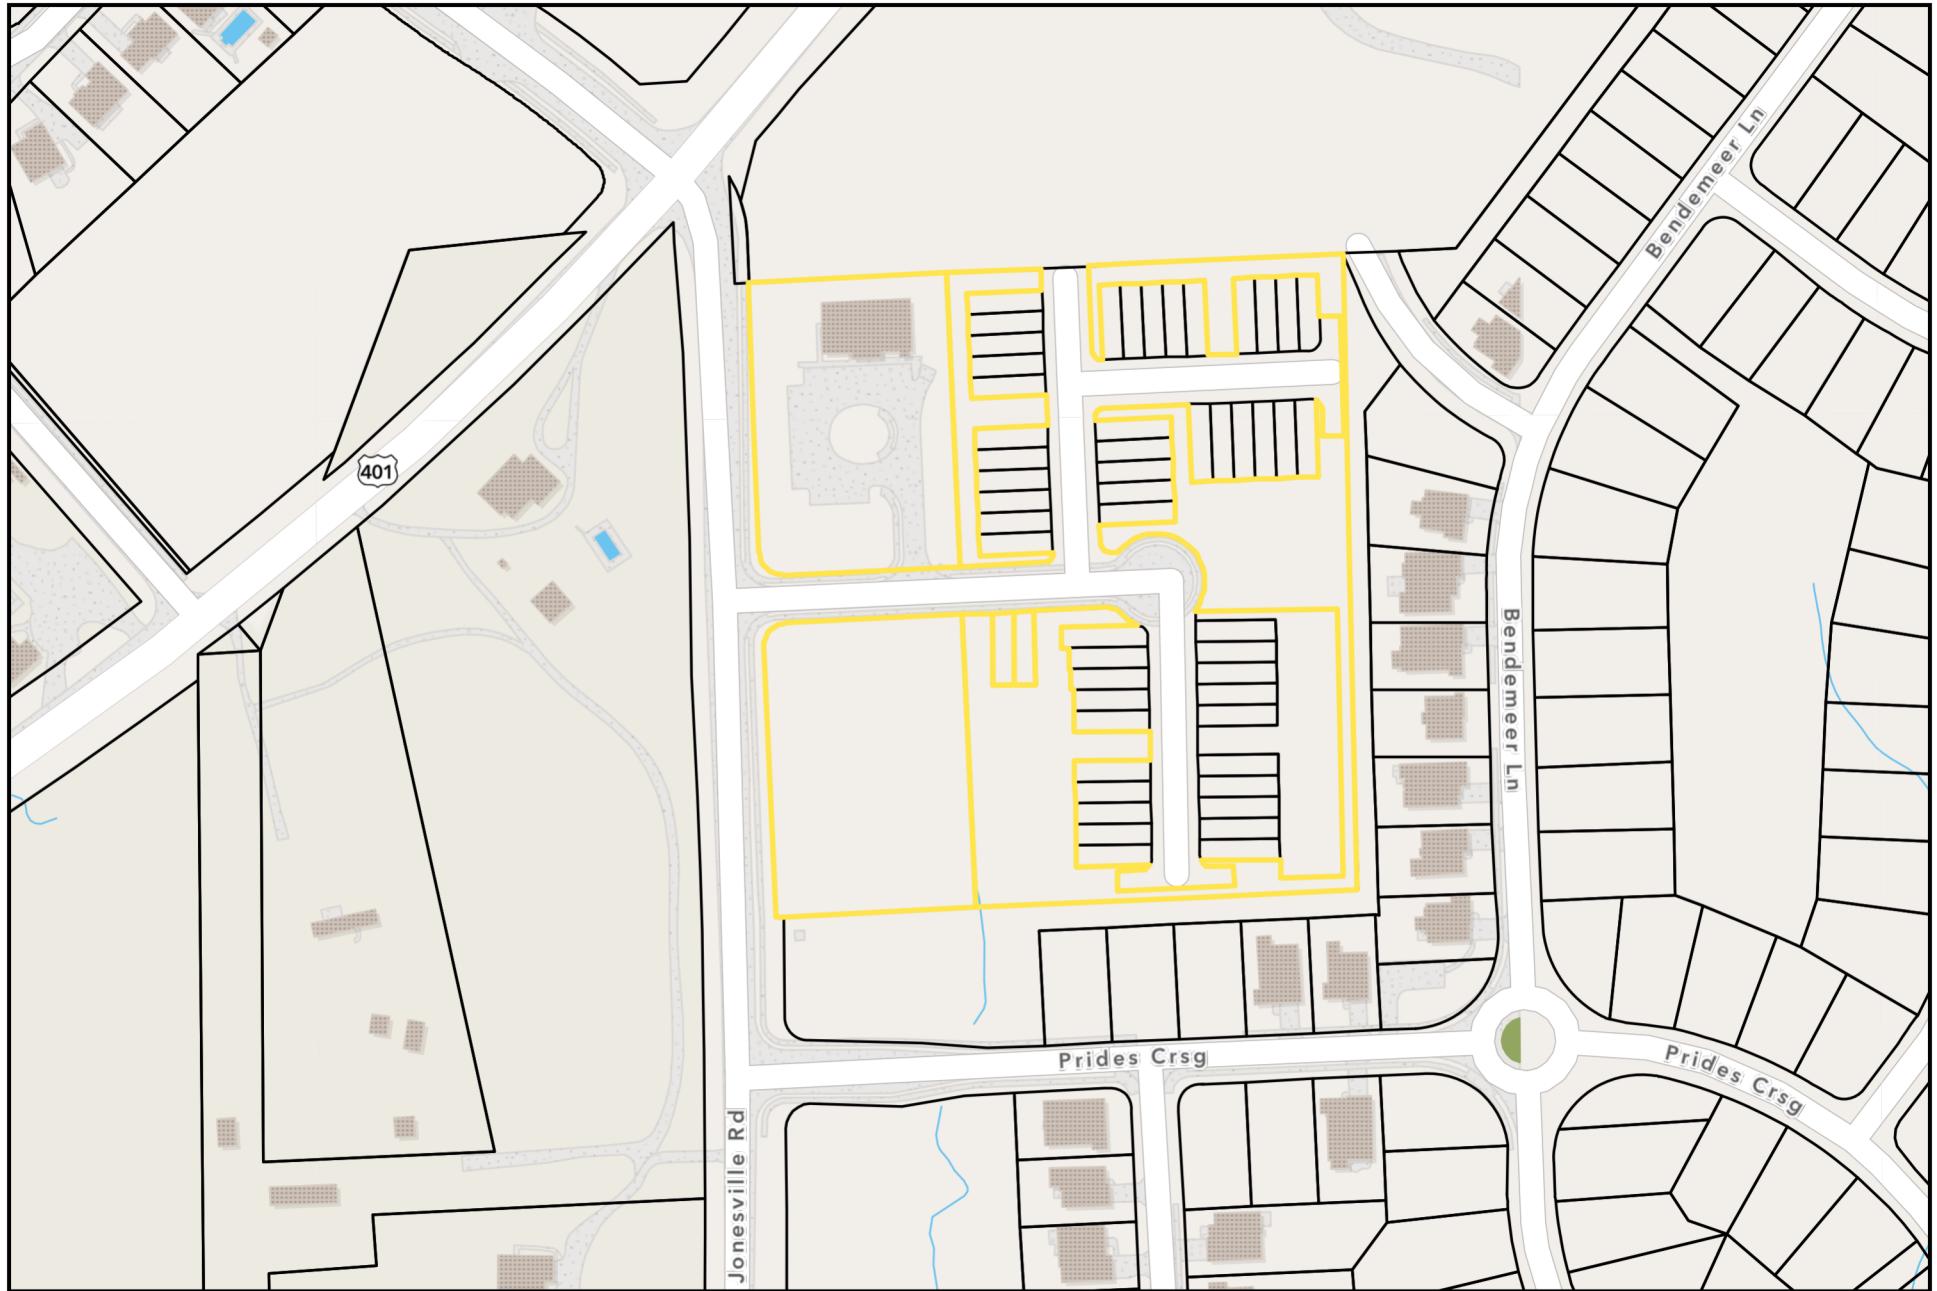

Q100 Backwater Effect at BMP (13. Z Wake County Checklist)

There is no storm pipe from the ROW that discharges to the BMP and as a result Q100 backwater review not needed.

Downstream Impact Analysis (DIA)

The Town of Rolesville requires a DIA to be performed with the 10% rule. As a result of the proposed Storm Filter BMP; the post runoff from the development of the project for the post Q10 will be reduced from the peak stormwater runoff (pre Q10) to below the predevelopment standards. The post stormwater runoff increase is less than 10% on adjacent properties at the POI noted on EX1.

Digital Data Available

No Digital Data Available

Unmapped

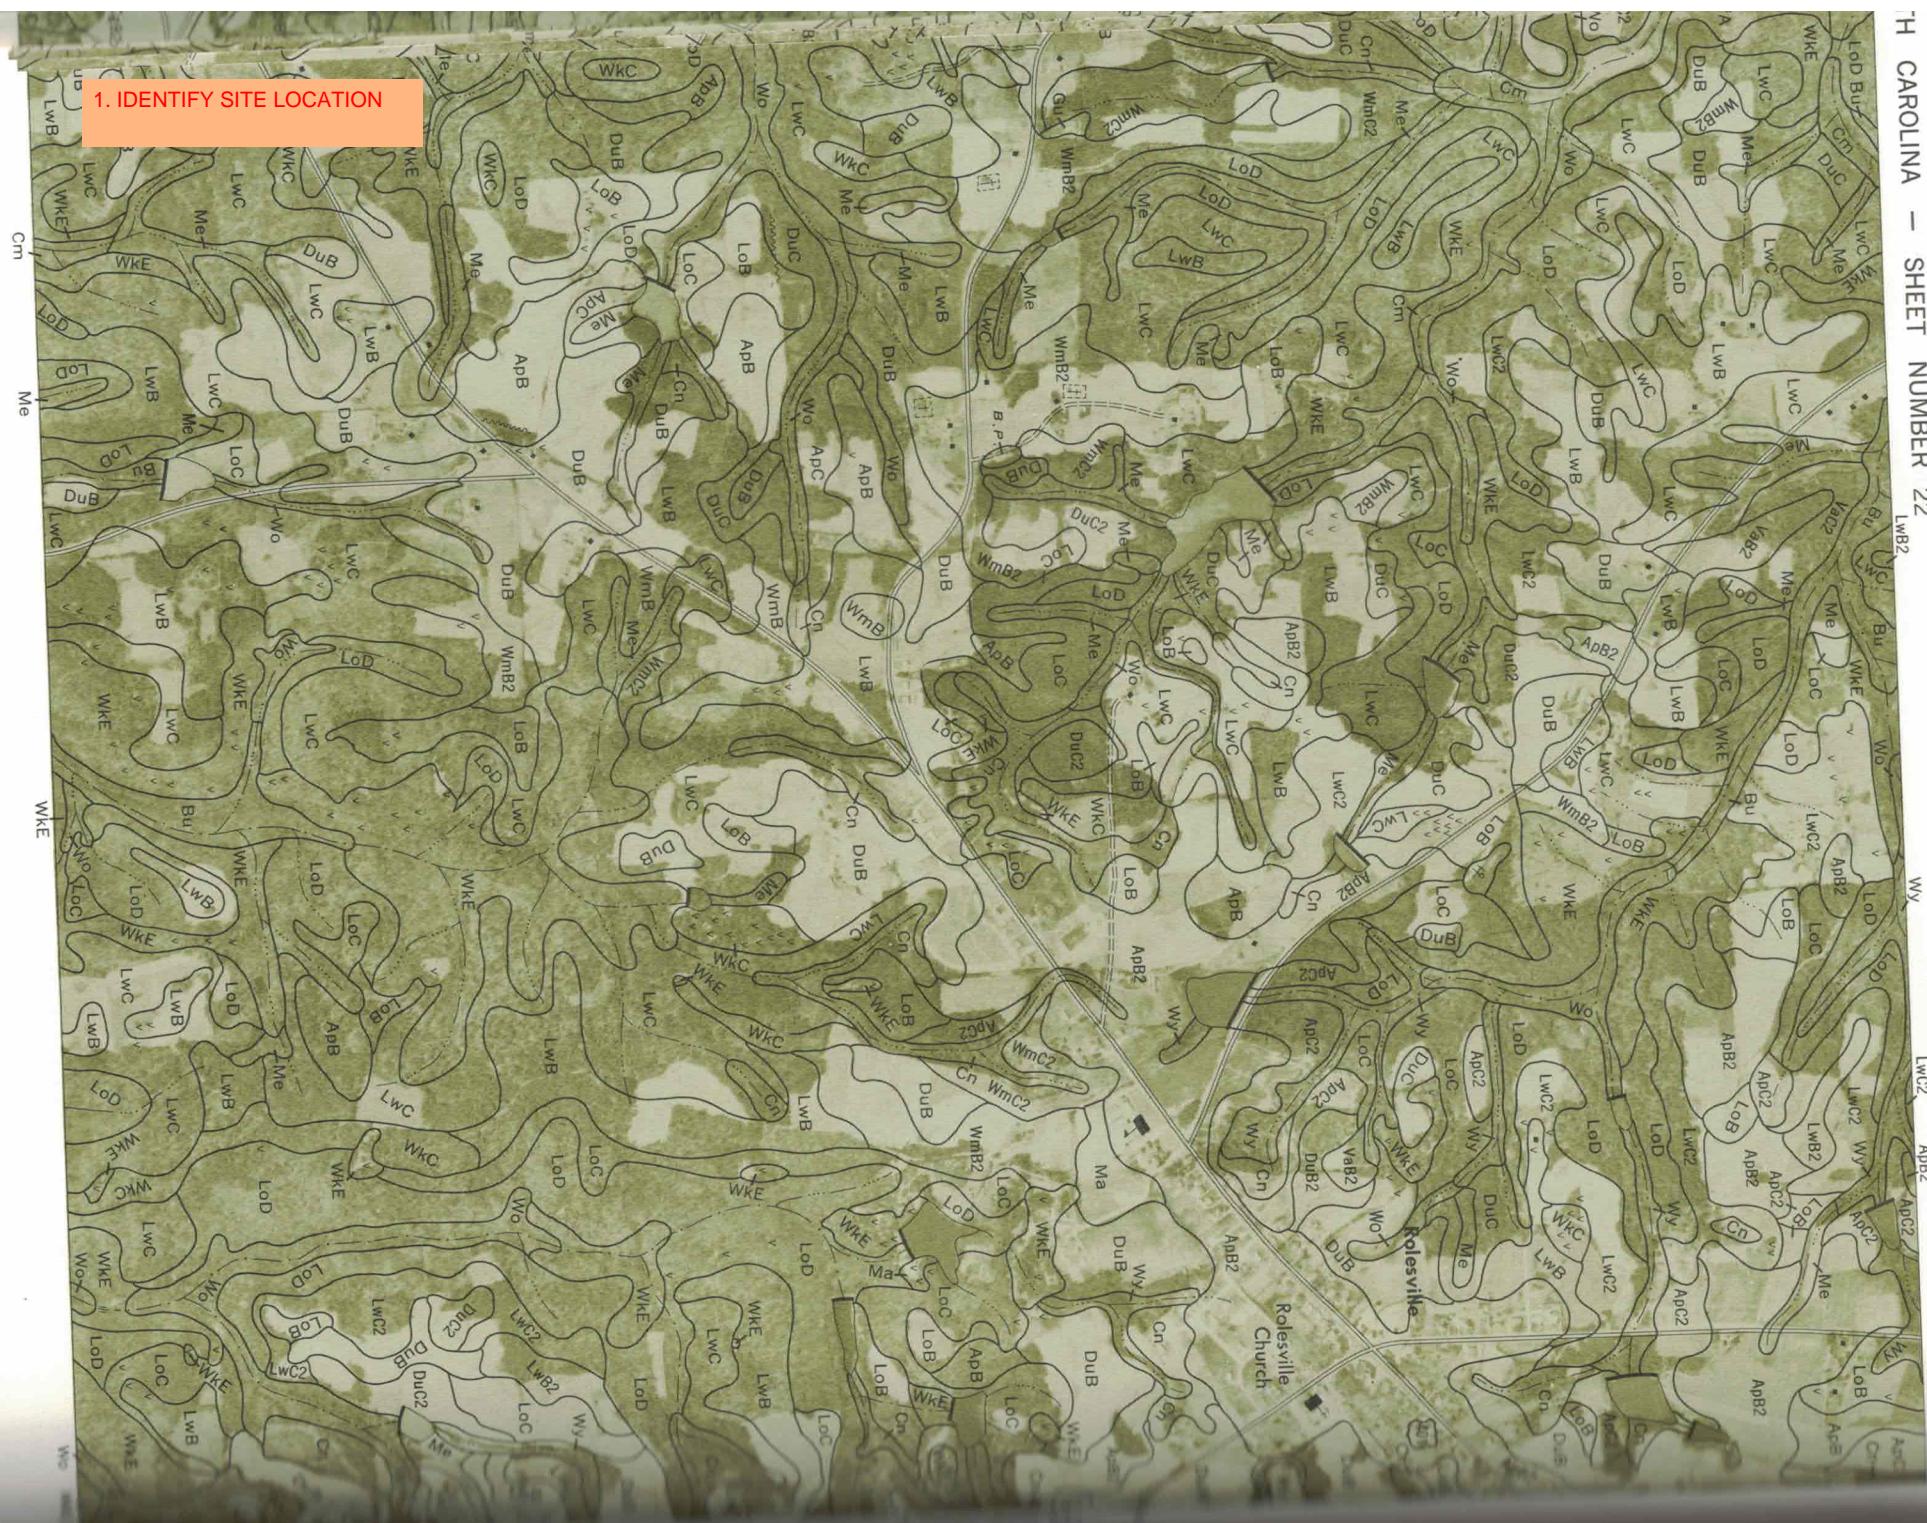

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 8/25/2023 at 5:37 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

<sup>1</sup> Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.
