## THE POINT - NORTH

### *Culvert Design Calculations*

#### GENERAL DESCRIPTION

The Point is a proposed residential development in Rolesville, North Carolina, located between Highway 401 and East Young Street/Rolesville Road. The development is approximately 300 acres, divided into a northern parcel and a southern parcel. This Stormwater Impact Analysis covers the development of the northern parcel only. Namely, the Northern Development will include 102 single-family lots, three stormwater control measures, sidewalks, roadways, greenway trail, and associated infrastructure.

An unnamed tributary to Harris Creek flows east to west through the project site. The tributary does not have an associated Special Flood Hazard Area (SFHA). A new culvert crossing consisting of one (1) 72" reinforced concrete pipe for main channel flow and (2) 60" reinforced concrete pipes for floodplain relief is proposed to extend the existing Genovesa Drive to the proposed development. This culvert design was selected to ensure there are no increases to the 100-year water surface elevations upstream of the project site.

Additionally, there is an existing culvert crossing consisting of a 60" corrugated metal pipe associated with a recreational trail near the southwestern corner of the project site. This crossing will be modified to serve as a connection between the private greenway on the Point North site and the public greenway west of the tributary. Due to the vertical constraints of the tie-in with the public greenway west of the tributary, it is not possible to raise the embankment of the crossing, nor is it possible to fit a larger culvert while still meeting minimum cover requirements. Instead, the retrofit of this crossing includes minor grading modifications to the embankment and an extension of the existing culvert.

#### HYDROLOGIC CALCULATION METHODOLOGY

- The SCS Curve Number Method was used to estimate direct runoff. A composite curve number was calculated for each subbasin using soils and land cover data.
- Depth-Duration Frequency (DDF) rainfall data was obtained from NOAA Atlas 14. Synthetic rainfall hyetographs were generated using frequency-based hypothetical storms assuming a storm duration of 1 day, intensity duration of 5 minutes, intensity position of 50%, and a uniform distribution for all subbasins. Rainfall depths were input into the meteorological model within PondPack for peak flow rate calculations. Please reference the rainfall data section within this report for additional information. Please refer to the precipitation information within the Miscellaneous Site Information section of this report for additional information.
- Hydrologic soil groups within each subbasin were determined using NRCS Web Soil Survey.
- Land cover conditions for the pre-development condition were based on survey provided by WithersRavenel and aerial imagery for the site. Land cover conditions for the post-development condition were taken from the proposed layout. Offsite cover conditions were based on survey provided by WithersRavenel, aerial imagery for the site, and Town of Rolesville Official Zoning Map.
- Soil Conservation Service Curve Numbers (SCS CN) most similar to the zoning type or cover condition were selected from Table 2 of the USDA TR-55, Urban Hydrology for Small Watersheds.
- The times of concentration were calculated using SCS TR-55 (Segmental Approach, 1986). The Tc flow path can be divided into multiple segments, as necessary: overland flow, concentrated flow, and channel flow. The travel

time was then computed for each segment, from which the overall time of concentration was determined by taking the sum of each segmental time.

- Existing conditions survey data and proposed grading was used for onsite topography. QL2 LiDAR topography data was obtained from North Carolina Spatial Data Download and used for offsite areas.
- PondPack Version V8i, by Bentley Systems, Inc., was used for the hydrologic calculations for the 10- and 25-, and 100-year storm events to determine the peak flow rates at the proposed Genovesa Drive crossing and the existing greenway crossing. These flows were used to design and evaluate the hydraulic performance of the proposed culvert configurations in HEC-RAS and HY8, respectively.
- For 100-year storm routing calculations, approximately 1-foot of freeboard is provided between the peak elevation during the 100-year storm event and the top of the dam for the proposed facilities.

## HYDRAULIC CALCULATION METHODOLOGY

### GREENWAY CROSSING

- Hydraulic calculations were performed using the Federal Highway Administration's HY-8 Culvert Hydraulic Analysis Program, version 7.7 to evaluate the performance of the existing culvert crossing and the proposed culvert crossing (with extensions).

### GENOVESA DRIVE CROSSING

- A hydraulic model was built for the Tributary to Harris Creek using the United States Army Corps of Engineers' HEC-RAS version 6.3 software. The model was run assuming a steady-state, subcritical flow regime and unobstructed flow through structures. Unobstructed flow occurs when flooding sources flow freely through all bridge and culvert structures. The flood elevations in the models are thus considered valid only if hydraulic structures remain unobstructed, operate properly, and do not fail.
- A composite digital elevation model (DEM) representing the site was created using existing conditions survey data and proposed grading supplemented with QL2 LiDAR topography data obtained from North Carolina Spatial Data Download. Cross section and road deck geometry was extracted from the composite DEM.
- Cross sections were drawn perpendicular to the direction of flow, as indicated by the topography. Cross sections were placed to capture structures (bridges, dams, or culverts), hydraulically significant changes in channel geometry, changes in flow rate, drastic narrowing or widening of the floodplain, prominent terrain features, and changes in channel slope.
- Bank stations were set to best represent the change in conveyance from the overbanks to the main channel.
- The proposed Genovesa Drive roadway crossing was modeled by placing four cross sections in accordance with the HEC-RAS Hydraulic Reference Manual. To represent the contraction and expansion of flow through the structure, the contraction and expansion coefficients were raised on structure cross sections 4, 3, and 2 and ineffective flow areas were added to structure cross sections 3 and 2. Ineffective flow area stationing was determined using a contraction ratio of 1:1 and expansion ratio of 2:1.

- Channel and overbank Manning's n values were assigned based on land cover characteristics as indicated by topographic data, aerial imagery, and the proposed site layout.
- The post-development 10-, 25-, and 100-year flow rates calculated at Genovesa Drive were applied to the HEC-RAS model at river station 2065.
- The normal depth method was used to set the downstream boundary condition for the model. Under the assumption of uniform flow conditions, the friction slope used to calculate normal depth is equal to the bed slope of the channel.
- The calculated water surface elevations were used to design and evaluate the hydraulic performance of the proposed Genovesa Drive culvert configuration.
- The output summary table, profile plot, and Genovesa Drive culvert cross section plots from the HEC-RAS model are provided in Section 8.0.

## DISCUSSION OF RESULTS

### GREENWAY CROSSING

As shown in Section 6 of this report, the greenway culvert crossing is overtopping in the 25-year storm event in the existing condition by 2.93 feet. Due to the vertical constraints of the tie-in with the public greenway west of the tributary, it is not possible to raise the embankment of the crossing above the 25-year water surface elevation, nor is it possible to fit a larger culvert capable of passing the 25-year flow while still meeting minimum cover requirements. The proposed design includes extending the existing culvert by approximately 13 feet. The change overtopping depth during the 25-year storm event from the pre-development to post-development condition is 0.07 feet, a negligible amount when compared to the 2.93 feet of overtopping already occurring in the existing condition.

### GENOVESA DRIVE CROSSING

As shown in Section 8 of this report, the proposed Genovesa Drive culvert configuration consisting of (1) 72" reinforced concrete pipe for main channel flow and (2) 60" reinforced concrete pipes for floodplain relief does not result in an increase in the 100-year water surface elevation on any neighboring properties.

### LIMITATIONS

If the development on this tract is built as proposed within this report, then the requirements set forth in the Town of Rolesville regulations will be met. Modifications to the proposed development may require that this analysis be revised. Some modifications that would **require** this analysis to be revised include:

1. The proposed site impervious surface exceeds the amount accounted for in this report.
2. The post-development watershed breaks change significantly from those used to prepare this report.
3. The grading and/or structures proposed adjacent to the stream differs from the grading and/or structures considered in this report.
4. The location or design of stream crossings differ from those considered in this report.

The above modifications may result in the assumptions within this report becoming invalid. The computations within this report will need to be revisited if any of the above conditions become apparent as development of the proposed site moves forward.

## *SUMMARY OF RESULTS*

The Point - North  
AWH-20000

## CULVERT DESIGN CALCULATIONS - PRE DEVELOPMENT

### Peak Flows Used for Culvert Sizing:

Q10, Peak = 686.58 cfs  
Q25, Peak = 847.78 cfs  
Q100, Peak = 1105.06 cfs

### Culvert 1 (Main Channel) Specifications:

Number of Barrels = 1  
Pipe Material = Corrugated Aluminium  
Culvert Diameter = 60 in  
US Pipe Invert = 303.18 ft  
DS Pipe Invert = 303.16 ft  
Pipe Length = 25.00 ft  
Embedment = 0.00 ft  
Slope = 0.0008 ft/ft

### Combined Culvert System Routing:

#### *10-Year Storm*

Headwater Elevation = 313.29 ft  
Hw/D = 2.0  
Road Crest Elevation = 310.76 ft  
Freeboard = -2.53 ft

#### *25-Year Storm*

Headwater Elevation = 313.69 ft  
Hw/D = 2.1  
Road Crest Elevation = 310.76 ft  
Freeboard = -2.93 ft

#### *100-Year Storm*

Headwater Elevation = 314.24 ft  
Hw/D = 2.2  
Road Crest Elevation = 310.76 ft  
Freeboard = -3.48 ft

## CULVERT DESIGN CALCULATIONS - POST DEVELOPMENT

### Peak Flows Used for Culvert Sizing:

Q10, Peak = 707.13 cfs  
Q25, Peak = 868.56 cfs  
Q100, Peak = 1125.42 cfs

### Culvert 1 (Main Channel) Specifications:

Number of Barrels = 1  
Pipe Material = Corrugated Aluminium  
Culvert Diameter = 60 in  
US Pipe Invert = 303.18 ft  
DS Pipe Invert = 303.16 ft  
Pipe Length = 37.25 ft  
Embedment = 0.00 ft  
Slope = 0.0005 ft/ft

### Combined Culvert System Routing:

#### 10-Year Storm

#### Increase Pre to Post:

|                        |           |         |
|------------------------|-----------|---------|
| Headwater Elevation =  | 313.36 ft | 0.07 ft |

This digital Flood Insurance Rate Map (FIRM) was produced through a unique cooperative relationship between the State of North Carolina and the Federal Emergency Management Agency (FEMA). The State of North Carolina has implemented a long term approach to floodplain management to decrease the costs associated with flooding. This is demonstrated by the State's commitment to no new flood hazard areas at the 1% level. As a part of this effort, the State of North Carolina has partnered in a Cooperating Technical State agreement with FEMA to produce and maintain this digital FIRM.

## NOTES TO USERS

For information and questions about this map, available products associated with this FIRM including historic versions of this FIRM, how to order products or the National Flood Insurance Program in general, please call the FEMA Map Information Exchange at 1 877 336 2627 or visit the FEMA Map Service Center website at <https://msc.fema.gov>. An accompanying Flood Insurance Study report, Letter of Map Revision (LOMR) or Letter of Map Amendment (LOMA) revising portions of this panel, and digital versions of this FIRM may be available. Visit the North Carolina Floodplain Mapping Program website at <https://flood.nc.gov/flood>, or contact the FEMA Map Service Center.

Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be ordered directly from the Map Service Center at the number listed above.

For community and countywide map dates refer to the Flood Insurance Study report for this jurisdiction.

To determine if flood insurance is available in the community, contact your insurance agent or call the National Flood Insurance Program at 1-800-331-6290.

Flood Insurance Study (FIS) means an examination, evaluation, and determination of flood hazards, corresponding water surface elevations, flood hazard risk zones, and other related data in a community issued by the North Carolina Floodplain Management Program. Flood Insurance Studies (FIS) are compiled into products used together, the Digital Flood Insurance Database, the Water Surface Elevation Reader, the digitally derived, auto-generated Flood Insurance Rate Map and the Flood Insurance Survey Report. A Flood Insurance Survey is a compilation and presentation of flood risk data for specific watercourses, lakes, and coastal flood hazard areas within a community. This report contains specific flood hazard data, data tables, and Flood Insurance. When a flood area is completed by the H-11, the digital information, reports and maps are assembled into its intended location shown on this FIRM in digital format by the NCFMP. Data from this information shown on this FIRM was provided in digital format by the NCFMP. The source of this information can be determined from the metadata available in the digital FIRM database and in the Technical Support Data Notebook (TSDN).

ACCRREDITED LEVEE NOTE TO USE: If an accredited levee note appears on this panel check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-percent-annual-chance level) and Emergency Action Plan, on the levee system(s) shown as providing protection for areas on this panel. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA Website at <https://www.fema.gov/national-flood-insurance-program>.

PROVISIONALLY ACCREDITED LEVEE NOTES TO USE: If a Provisionally Accredited Levee (PAL) note appears on this panel check with your local community to obtain more information, such as the estimated level of protection provided (which may exceed the 1-percent-annual-chance level) and Emergency Action Plan, on the levee system(s) shown as providing protection for areas on this panel. To maintain accreditation, the levee owner or community is required to submit the data and documentation necessary to comply with Section 65.10 of the NFIP regulations. If the data or documentation provided on the panel does not meet the requirements of the NFIP regulations and documentation provided indicates the levee system(s) does not comply with Section 65.10 requirements, FEMA will revise the flood hazard and risk information for this area to reflect de-accreditation of the levee system. To mitigate flood risk in residual risk areas, property owners and residents are encouraged to consider flood insurance and floodproofing or other protective measures. For more information on flood insurance, interested parties should visit the FEMA Website at <https://www.fema.gov/national-flood-insurance-program>.

LIMIT OF MODERATE WAVE ACTION NOTES TO USERS: For some coastal flooding zones the AE Zone category has been divided by a Limit of Moderate Wave Action (LIMA). The LIMA represents the approximate inundation limit of the 1-5% wave-averaging wave. The effects of wave hazards for the VE Zones and the LIMA (or between the shoreline and the LIMA for areas where VE Zones are not identified) will be similar, but less severe than those in the VE Zone.

Limit of Moderate Wave Action (LIMA)

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Wake County, North Carolina

Survey Area Data: Version 20, Jun 3, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Oct 11, 2019—Oct 19, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

**Group A.** Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

**Group B.** Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

**Group C.** Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

**Group D.** Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

<sup>1</sup> Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

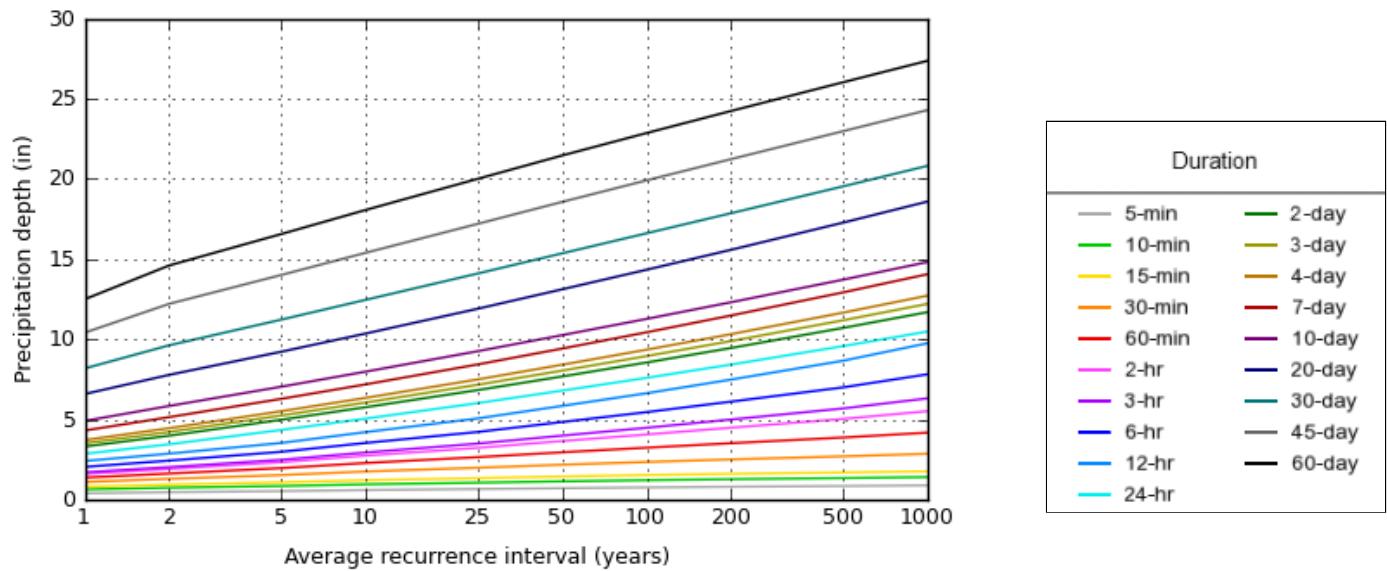

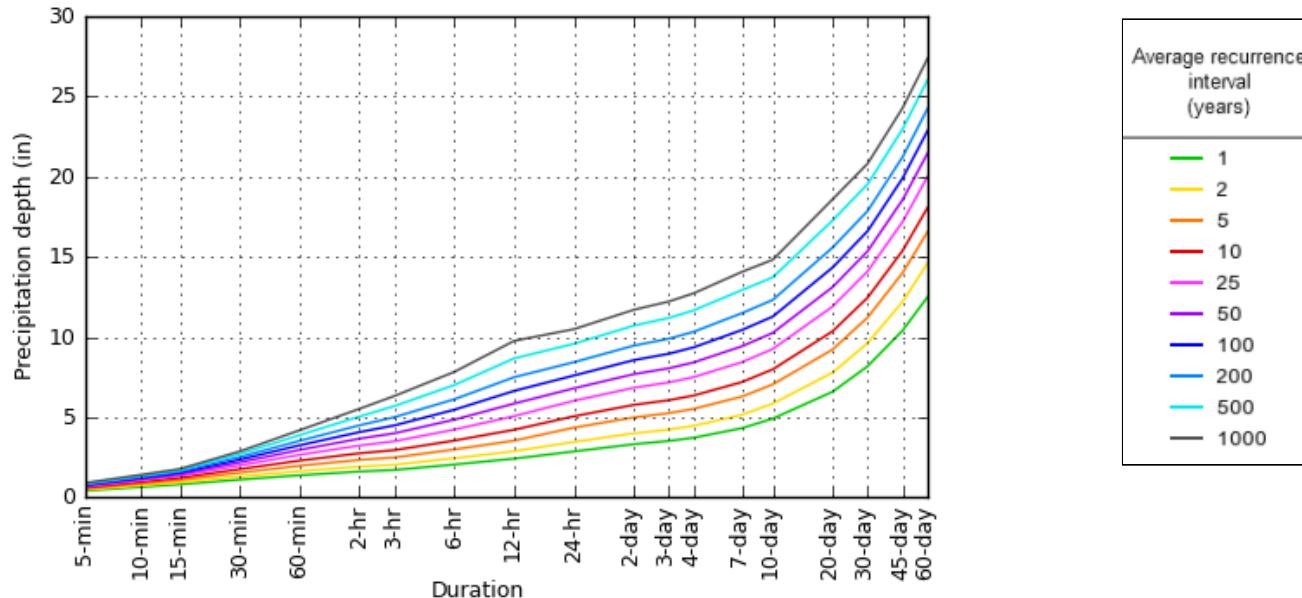

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

The Point - North  
AWH-20000

## CULVERT DESIGN CALCULATIONS - PRE DEVELOPMENT

### Peak Flows Used for Culvert Sizing:

Q10, Peak = 686.58 cfs  
Q25, Peak = 847.78 cfs  
Q100, Peak = 1105.06 cfs

### Culvert 1 (Main Channel) Specifications:

Number of Barrels = 1  
Pipe Material = Corrugated Aluminium  
Culvert Diameter = 60 in  
US Pipe Invert = 303.18 ft  
DS Pipe Invert = 303.16 ft  
Pipe Length = 25.00 ft  
Embedment = 0.00 ft  
Slope = 0.0008 ft/ft

### Combined Culvert System Routing:

#### *10-Year Storm*

Headwater Elevation = 313.29 ft  
Hw/D = 2.0  
Road Crest Elevation = 310.76 ft  
Freeboard = -2.53 ft

#### *25-Year Storm*

Headwater Elevation = 313.69 ft  
Hw/D = 2.1  
Road Crest Elevation = 310.76 ft  
Freeboard = -2.93 ft

#### *100-Year Storm*

Headwater Elevation = 314.24 ft  
Hw/D = 2.2  
Road Crest Elevation = 310.76 ft  
Freeboard = -3.48 ft

# Culvert Crossing: Pre Development

---

Crossing Summary Table

| Headwater Elevation (ft) | Total Discharge (cfs) | Existing Discharge (cfs) | Roadway Discharge (cfs) | Iterations  |
|--------------------------|-----------------------|--------------------------|-------------------------|-------------|
| 313.29                   | 686.58                | 206.87                   | 479.32                  | 6           |
| 313.40                   | 728.43                | 206.86                   | 521.41                  | 4           |
| 313.51                   | 770.28                | 206.81                   | 563.32                  | 4           |

## CULVERT DESIGN CALCULATIONS - POST DEVELOPMENT

### Peak Flows Used for Culvert Sizing:

Q10, Peak = 707.13 cfs  
Q25, Peak = 868.56 cfs  
Q100, Peak = 1125.42 cfs

### Culvert 1 (Main Channel) Specifications:

Number of Barrels = 1  
Pipe Material = Corrugated Aluminium  
Culvert Diameter = 60 in  
US Pipe Invert = 303.18 ft  
DS Pipe Invert = 303.16 ft  
Pipe Length = 37.25 ft  
Embedment = 0.00 ft  
Slope = 0.0005 ft/ft

### Combined Culvert System Routing:

#### 10-Year Storm

#### Increase Pre to Post:

|                        |           |         |
|------------------------|-----------|---------|
| Headwater Elevation =  | 313.36 ft | 0.07 ft |
| Hw/D =                 | 2.0       |         |
| Road Crest Elevation = | 310.76 ft |         |
| Freeboard =            | -2.60 ft  |         |

#### 25-Year Storm

|                        |           |         |
|------------------------|-----------|---------|
| Headwater Elevation =  | 313.76 ft | 0.07 ft |
| Hw/D =                 | 2.1       |         |
| Road Crest Elevation = | 310.76 ft |         |
| Freeboard =            | -3.00 ft  |         |

#### 100-Year Storm

|                        |           |         |
|------------------------|-----------|---------|
| Headwater Elevation =  | 314.29 ft | 0.05 ft |
| Hw/D =                 | 2.2       |         |
| Road Crest Elevation = | 310.76 ft |         |
| Freeboard =            | -3.53 ft  |         |

# Culvert Crossing: Post Development

---

Crossing Summary Table

| Headwater Elevation (ft) | Total Discharge (cfs) | Existing with Extensions Discharge (cfs) | Roadway Discharge (cfs) | Iterations  |
|--------------------------|-----------------------|--|-------------------------|-------------|
| 313.36                   | 707.13                | 200.53                                   | 506.27                  | 6           |
| 313.47                   | 748.96                | 200.50                                   | 548.31                  | 4           |
| 313.57                   | 790.79                | 200.43                                   | 590.22                  | 4           |

## CULVERT DESIGN CALCULATIONS

### Peak Flows Used for Culvert Sizing:

|              |        |     |
|--------------|--------|-----|
| Q10, Peak =  | 184.92 | cfs |
| Q25, Peak =  | 224.21 | cfs |
| Q100, Peak = | 284.48 | cfs |

### Culvert 1 (Main Channel) Specifications:

|                     |          |       |
|---------------------|----------|-------|
| Shape:              | Circular |       |
| Number of Barrels = | 1        |       |
| Culvert Diameter =  | 72       | in    |
| US Pipe Invert =    | 347.00   | ft    |
| DS Pipe Invert =    | 344.18   | ft    |
| Pipe Length =       | 82.00    | ft    |
| Embedment =         | 1.00     | ft    |
| Slope =             | 0.0344   | ft/ft |

### Culvert 2 (Floodplain) Specifications:

|                     |          |       |
|---------------------|----------|-------|
| Shape:              | Circular |       |
| Number of Barrels = | 2        |       |
| Culvert Diameter =  | 60       | in    |
| US Pipe Invert =    | 348.51   | ft    |
| DS Pipe Invert =    | 347.44   | ft    |
| Pipe Length =       | 82.00    | ft    |
| Embedment =         | 0.00     | ft    |
| Slope =             | 0.0130   | ft/ft |

### Combined Culvert System Routing:

#### 10-Year Storm

|                        |        |    |
|------------------------|--------|----|
| Headwater Elevation =  | 350.73 | ft |
| Hw/D =                 | 0.5    |    |
| Road Crest Elevation = | 375.05 | ft |
| Freeboard =            | 24.32  | ft |

#### 25-Year Storm

|                        |        |    |
|------------------------|--------|----|
| Headwater Elevation =  | 350.89 | ft |
| Hw/D =                 | 0.6    |    |
| Road Crest Elevation = | 375.05 | ft |
| Freeboard =            | 24.16  | ft |

#### 100-Year Storm

|                        |        |    |
|------------------------|--------|----|
| Headwater Elevation =  | 351.35 | ft |
| Hw/D =                 | 0.7    |    |
| Road Crest Elevation = | 375.05 | ft |
| Freeboard =            | 23.70  | ft |

### Velocity Dissipator Specifications:

|                 |       |    |
|-----------------|-------|----|
| Length =        | 24.00 | ft |
| Width =         | 33.00 | ft |
| Thickness=      | 27.00 | in |
| Classification= | I     |    |

TABLE 1: EXISTING CONDITIONS VS. PROPOSED CONDITIONS

| Cross Section | 100yr Water Surface Elevation |                     |            |
