From: Bryan C. Fagundus, PE

Subject: Public Storm Sewer Pipe Network Design – Wallbrook Development – Rolesville, Wake County, NC

**Project Summary**

The purpose of this memorandum is to present the design calculations for the public storm sewer pipe network for Wallbrook Drive and Virginia Water Drive as part of the Wallbrook Development. The total development consists of approximately 64.39 acres with approximately 2.50 acres within the public rights-of-way of Virginia Water Drive and Wallbrook Drive. The site is located on the South side of Main Street (US 401) in Rolesville, NC. (Reference Wallbrook Preliminary Plat PR21-04 and Wallbrook Roadway Improvements CID23-01).

Lines 22 (211A-DI), 19 (213A-DI), and 15 (215A-DI) represent future drainage areas from Lot 5 as shown on PR 21-04 to the proposed public storm sewer system. Line 23 represents a known flow (Q) of 75.80 cfs during the 10-yr rain event that is routed into 203-CB of the proposed public storm sewer system from NCDOT's U-6241 project. Lines 25, 27, and 31 represent yard inlets to capture runoff around the proposed retaining wall and conveyed to the proposed public storm sewer system. Line 18 represents a drop inlet on Lot 6 (CD 22-02: Wallbrook Townhomes) to capture a small portion of runoff and conveyed through the proposed public storm sewer system. Lines 32 and 33 represent the outlet pipes from the proposed stormwater control measure.

Calculation Methodology & Constants

- A minimum time of concentration of 5 minutes was utilized
- A minimum rational C value of 0.85 was utilized
- RCP utilizes a Manning's n value of 0.013
- PVC pipes utilize a Manning's n value of 0.012
- The minimum size used for RCP is 15"
- Rainfall data was taken from NOAA Atlas 14 at the Neuse 2 NE station

Analysis

The pipe networks were modeled using Autodesk Civil 3D and the model data was exported to Hydraflow Storm Sewer software for analysis. The attached results show that the drainage network meets Wake County and Town of Rolesville regulations and standards as follows:

- The gutter spread for the 1-year, approximately 4 in/hr storm, does not encroach more than 10' into the adjacent driving lane for the public storm sewer system.
- The total flow (cfs) within the storm sewer system does not exceed the flow capacity (cfs) in the pipe network in the 10-year rain event for storm sewer system.
- The 10-yr rain event HGL is contained within the public storm sewer system.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.
